- Particle on a ring
 - Polar Coordinates
 - Laplacian and Hamiltonian operator
 - General solutions
 - Angular momentum
- Particle on a sphere
 - Spherical Coordinates
 - Laplacian and Hamiltonian operator
 - Spherical harmonics
 - Angular momentum

- This lecture is designed to help you achieve the following learning objectives
 - Obtain and interpret solutions of the Schrodinger equation for tractable systems including the particle in a box, harmonic oscillator, rigid rotor, and hydrogen atom
 - Describe how analytical models help interpret various experimental spectra

Particle on a Ring

- 1D Particle in a box, confined to a specific range of x.
 - . Hamiltonian is $\hat{\mathbf{H}} = -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2}$.
- 2D Particle in a box, confined to a specific range of x and y.

• Hamiltonian is
$$\hat{\mathbf{H}} = -\frac{\hbar^2}{2m} \left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right)$$

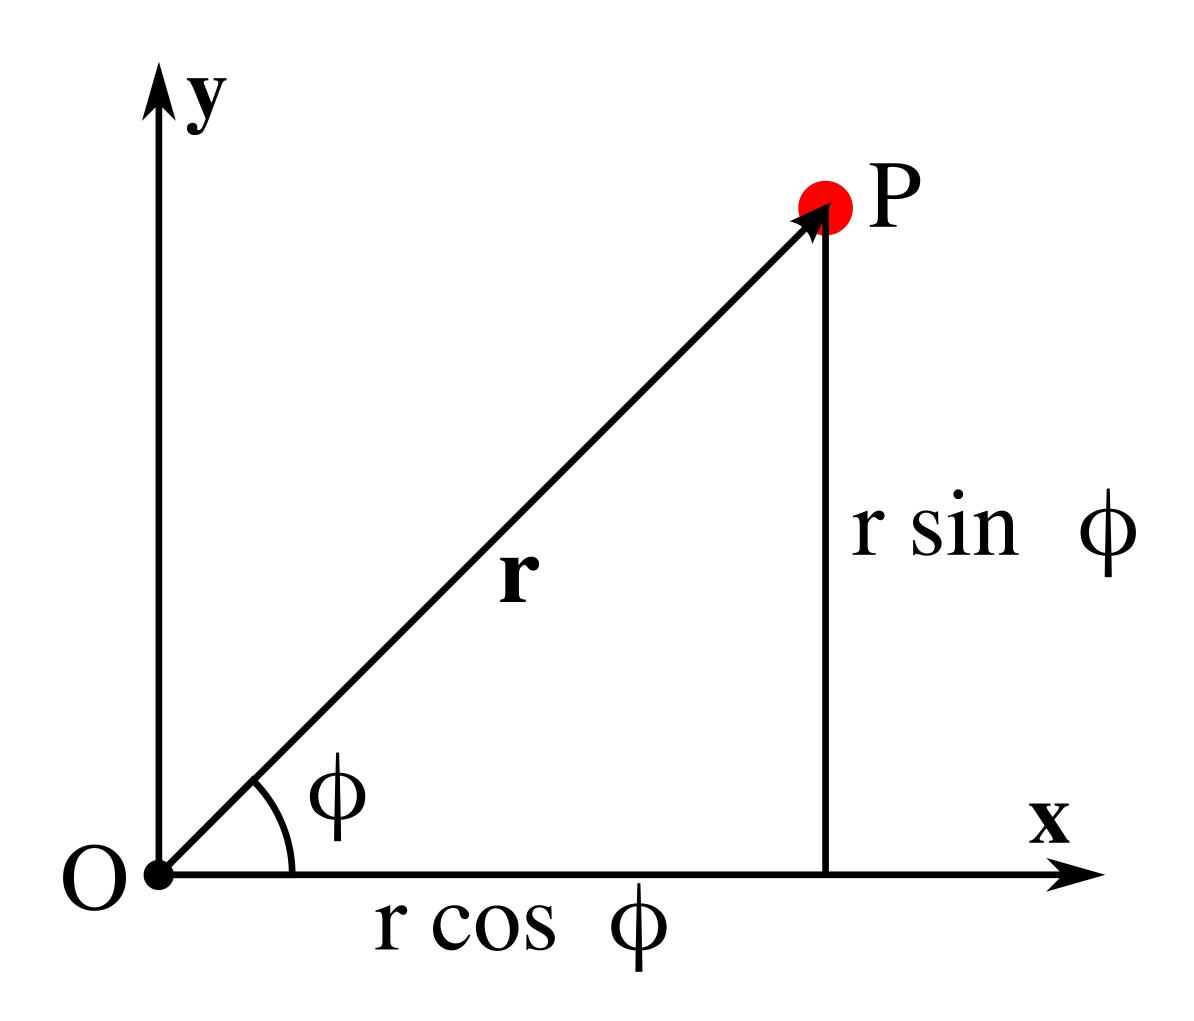

- . Alternatively, $\hat{\mathbf{H}}=-\frac{\hbar^2}{2m}\nabla^2$, where ∇^2 is the Laplacian operator.
- Particle on a ring, confined to a specific value of r. What is the kinetic energy?

Polar Coordinates

- $x = r \cos \phi$
- $y = r \sin \phi$

$$r = \sqrt{x^2 + y^2}$$

$$\phi = \arctan\left(\frac{y}{x}\right)$$

The Chain Rule

- u(x, y) is a function that depends on x and y
- $\delta u(x,y) = \frac{\partial u}{\partial x} \delta x + \frac{\partial u}{\partial y} \delta y \text{ is differential for u}$
- Now let's say that x = x(s, t) and y = y(s, t). The chain rule says that,

$$\frac{\partial u}{\partial s} = \frac{\partial u}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial s}.$$

• What about $\frac{\partial u}{\partial t}$?

Hamiltonian of POR

Using the chain rule, one can obtain the Laplacian in polar coordinates as

$$\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} = \frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \frac{\partial^2}{\partial \phi^2}$$

$$\frac{\partial}{\partial x^2} + \frac{\partial}{\partial y^2} = \frac{\partial}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \frac{\partial}{\partial \phi^2}$$

$$\hat{\mathbf{H}} = \frac{-\hbar^2}{2m} \left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) = \frac{-\hbar^2}{2m} \left(\frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{1}{r^2} \frac{\partial^2}{\partial \phi^2} \right)$$

For a particle on a ring, r is constant, so $\hat{\mathbf{H}} = \frac{-\hbar^2}{2m} \left(\frac{1}{r^2} \frac{d^2}{d\phi^2} \right)$

Schrodinger Equation

•
$$\frac{-\hbar^2}{2m}\left(\frac{1}{r^2}\frac{d^2}{d\phi^2}\right)\Psi=E\Psi$$
 is the Schrodinger equation for the system • $\frac{d^2\Phi}{d\phi^2}=-\frac{2IE}{\hbar^2}\Phi$ (using $I=mr^2$ and swapping notation for the wavefunction)

. The general solution is $\Phi = Ae^{im_l\phi} + Be^{-im_l\phi}$, where $m_l = \sqrt{\frac{2IE}{\hbar^2}}$.

Schrodinger Equation Solutions

•
$$\Phi = Ae^{im_l\phi} + Be^{-im_l\phi}$$
, where $m_l = \sqrt{\frac{2IE}{\hbar^2}}$.

- The boundary conditions are $\Phi(\phi+\dot{2}\pi)=\Phi(\phi)$, or $Ae^{im_l\phi}e^{2\pi im_l}+Be^{-im_l\phi}e^{-2\pi im_l}=Ae^{im_l\phi}+Be^{-im_l\phi}$
- Thus, $e^{2\pi i m_l} = \cos(2\pi m_l) + i\sin(2\pi m_l) = 1$ must be true.
- When is this true?
- Given $m_l = \sqrt{\frac{2IE}{\hbar^2}}$, what are the energy levels of a particle on a ring?
- Are there degenerate states (states with the same energy)?

Normalization

- If B = 0, then $\Phi = Ae^{im_l\phi}$
- What is A?

Angular Momentum

• In classical mechanics, angular momentum is the cross product of the position

- The z component is $l_z = xp_y yp_x$
- Using the momentum operator in the position representation,

$$\hat{\mathbf{l}}_z = \frac{\hbar}{i} \left(x \frac{\partial}{\partial y} + y \frac{\partial}{\partial x} \right) = \frac{\hbar}{i} \frac{\partial}{\partial \phi}$$
• If $\Phi = Ae^{im_l\phi}$, what is the angular momentum?

Postulate 3 Self-Test

$$\Phi = \sqrt{\frac{1}{3}} \sqrt{\frac{1}{2\pi}} - \sqrt{\frac{2}{3}} \sqrt{\frac{1}{2\pi}} e^{-2i\phi}$$

Probability Energy Angular Momentum

- What are the angular momentum quantum numbers?
- What are the normalized wavefunctions ϕ_n ?
- What the the coefficients c_n ?

Expectation

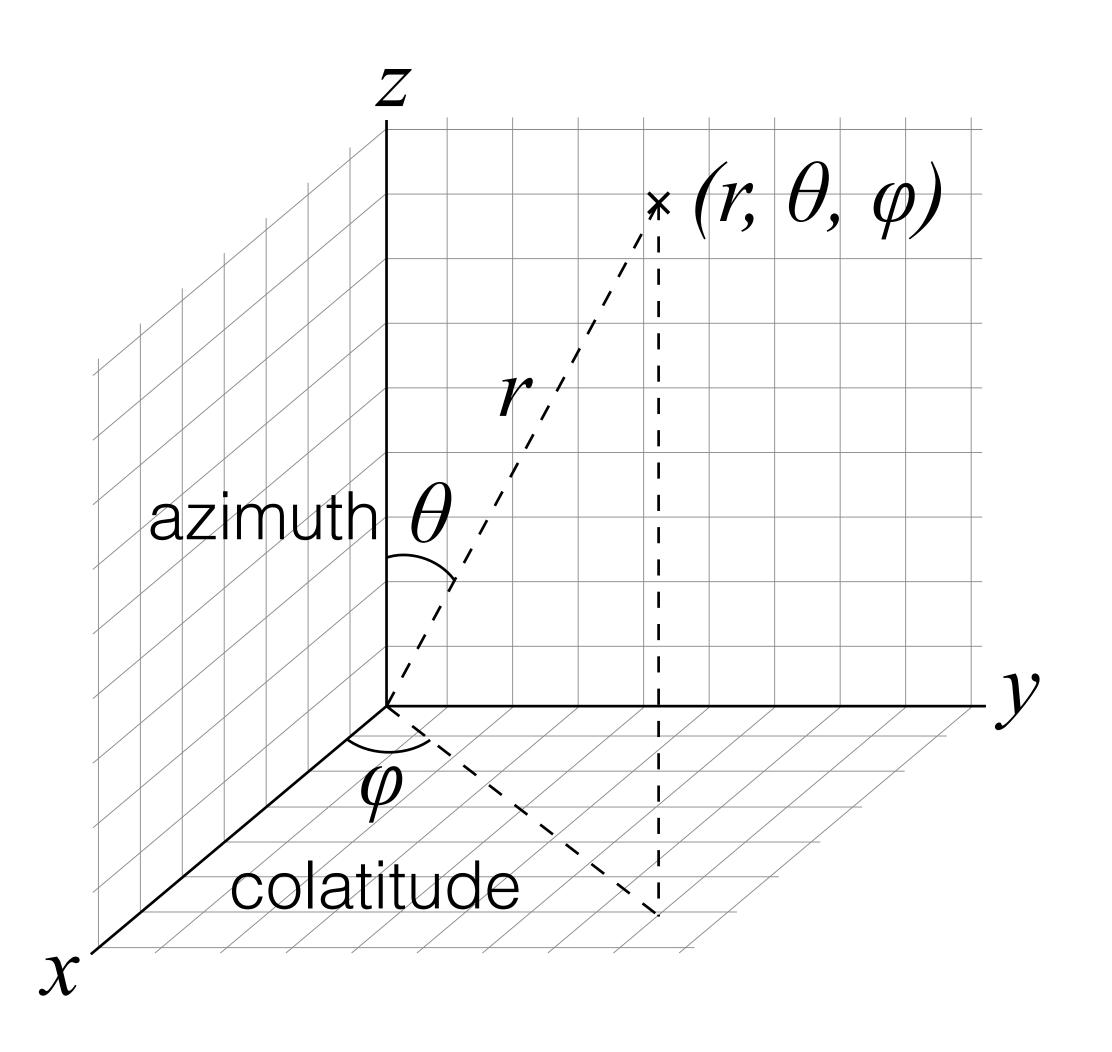

Particle on a Sphere

Spherical Polar Coordinates

- The mapping from spherical polar to Cartesian coordinates is,
 - $x = r \sin \theta \cos \phi$
 - $y = r \sin \theta \sin \phi$
 - $z = r \cos \theta$
- The Laplacian is,

$$\hat{\nabla}^2 = \frac{1}{r} \frac{\partial^2}{\partial r^2} r + \frac{1}{r^2} \hat{\Lambda}^2$$

$$\hat{\Lambda}^2 = \frac{1}{\sin^2\theta} \frac{\partial^2}{\partial \phi^2} + \frac{1}{\sin\theta} \frac{\partial}{\partial \theta} \sin\theta \frac{\partial}{\partial \theta} \text{ is called the}$$
 Legendrian

Schrodinger Equation

$$\hat{\mathbf{H}} = \frac{-\hbar^2}{2m} \hat{\nabla}^2 = \frac{-\hbar^2}{2mr^2} \hat{\Lambda}^2 \text{ is the Hamiltonian if } r \text{ is constant}$$

$$\hat{\Lambda}^2 \Psi = -\frac{2IE}{\hbar^2} \Psi \text{ is the Schrodinger equation}$$

$$\hat{\Lambda}^2 = \frac{1}{\sin^2 \theta} \frac{\partial^2}{\partial \phi^2} + \frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \sin \theta \frac{\partial}{\partial \theta}$$

Separation of Variables

• Applying the Legendrian to $\Psi(\theta,\phi)=\Theta(\theta)\Phi(\phi)$ gives

$$\hat{\mathbf{\Lambda}}^2 \Theta \Phi = \Theta \frac{1}{\sin^2 \theta} \frac{\partial^2}{\partial \phi^2} \Phi + \Phi \frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \sin \theta \frac{\partial}{\partial \theta} \Theta = -\frac{2IE}{\hbar^2} \Theta \Phi$$

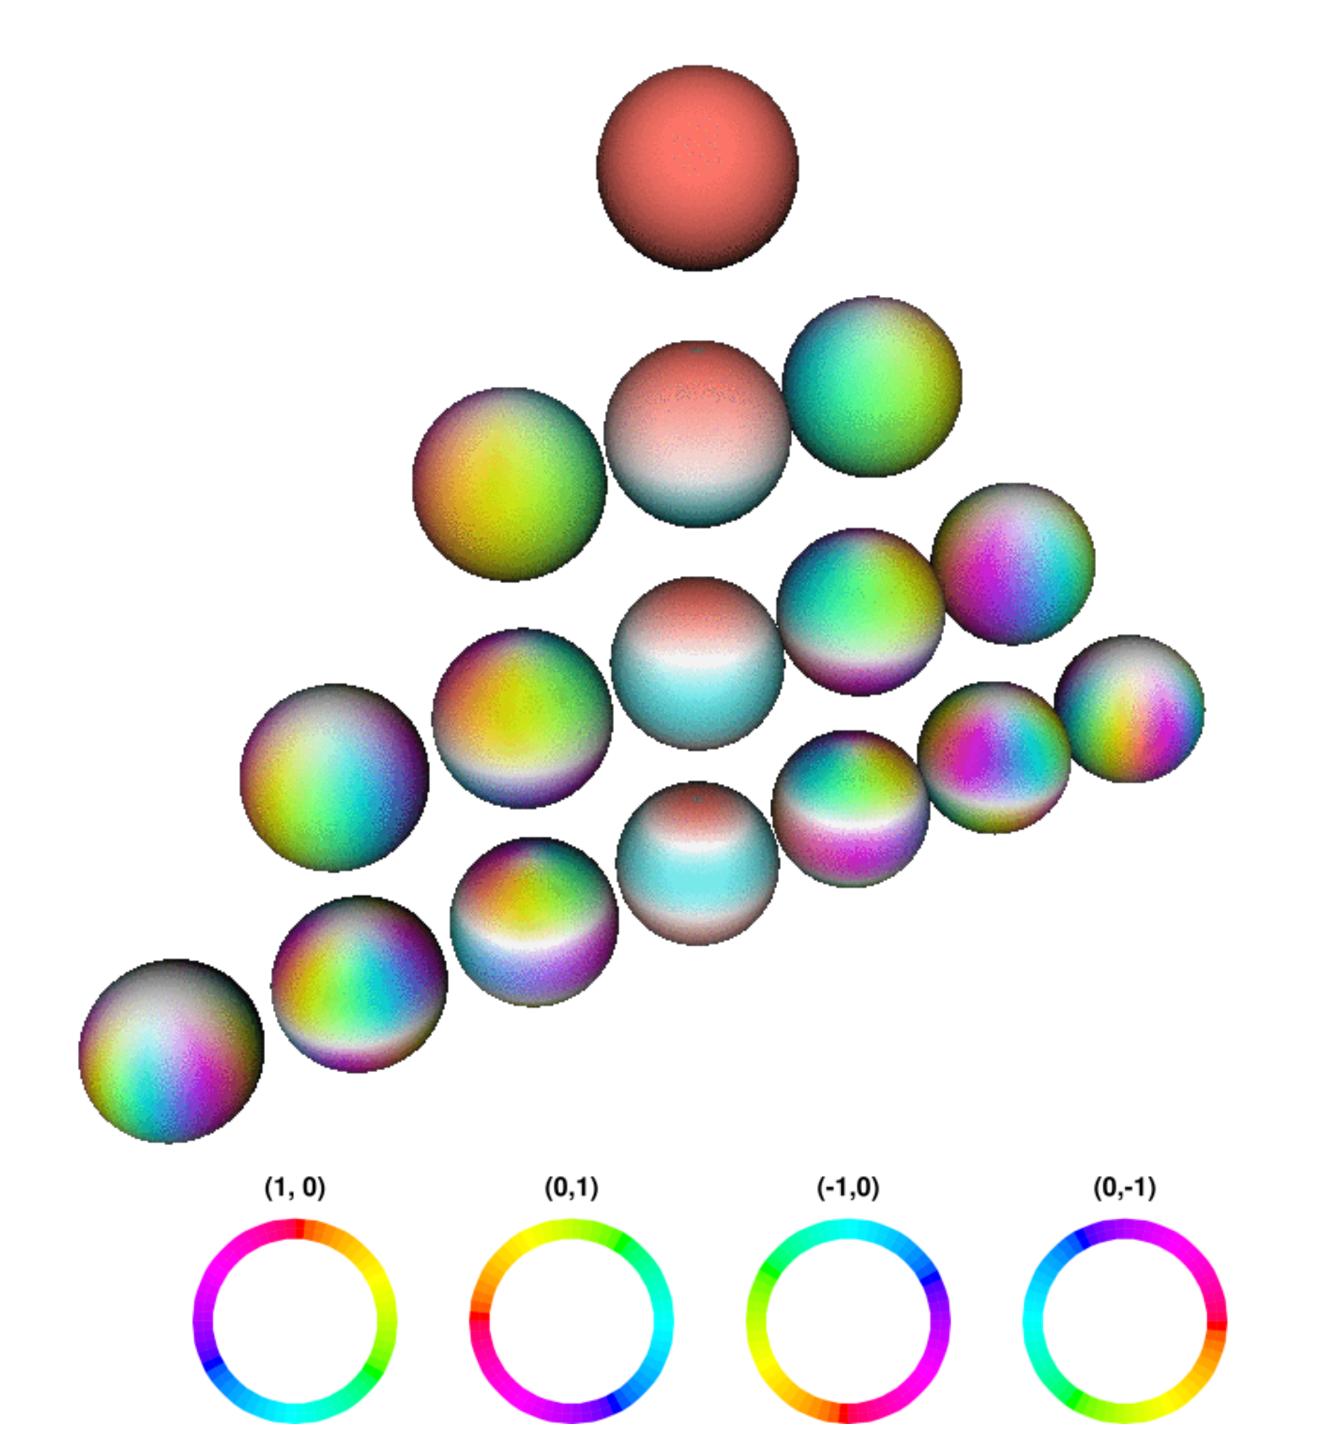

$$\frac{1}{\Phi} \frac{\partial^2}{\partial \phi^2} \Phi + \frac{1}{\Theta} \sin \theta \frac{\partial}{\partial \theta} \sin \theta \frac{\partial}{\partial \theta} \Theta = -\frac{2IE}{\hbar^2} \sin^2 \theta \text{ by rearrangement}$$

- For Φ , this has the form $\frac{d^2}{d\phi^2}\Phi=k\Phi$, the same as the particle on the ring
- For Θ , the solutions are known as *Spherical Harmonics*

Spherical Harmonics

- The spherical harmonics, $Y_{lm_l}(\theta,\phi)=\Theta_{lm_l}(\theta)\Phi_{m_l}(\phi)$, are separable solutions to the Schrodinger equation
- For these equations, applying the Legendrian operator yields
 - $\hat{\Lambda}^2 Y_{lm_l} = -l(l+1)Y_{lm_l}$, where Y_{lm_l} are spherical harmonics
 - l = 0.1.2...
 - $m_l = l, l 1, l 2, ..., -l$
- Be rearranging $\frac{2IE_{lm_l}}{\hbar^2}=-l(l+1)$, we see that the allowed energy levels are, $E_{lm}=\frac{\hbar^2l(l+1)}{\hbar^2}$

$$E_{lm_l} = \frac{\hbar^2 l(l+1)}{2I}$$
. Notably, this does not depend on m_l .

Visualizing Spherical Harmonics

http://demonstrations.wolfram.com/SphericalHarmonics/

What is the relationship between l, m_l , and the number of angular nodes?

Angular Momentum: Components

Recall that the z component of angular momentum is

$$\hat{\mathbf{l}}_z = \frac{\hbar}{i} \left(x \frac{\partial}{\partial y} + y \frac{\partial}{\partial x} \right) = \frac{\hbar}{i} \frac{\partial}{\partial \phi}$$

- $\hat{\mathbf{l}}_z Y_{lm_l} = m_l \hbar Y_{lm_l}$, the same as a particle on a ring
- Due to the uncertainty principle, x and y components cannot be simultaneously determined

Angular Momentum: Magnitude

Classical energy

- Linear momentum: $E = \frac{1}{2}mv^2$. p = mv. $E = \frac{p^2}{2m}$.
- Angular momentum: $E=\frac{1}{2}I\omega^2$. $L=I\omega$. $E=\frac{L^2}{2I}$.
- $\hat{\mathbf{L}}^2 = 2I\hat{\mathbf{H}} = 2I\frac{-\hbar^2}{2I}\hat{\mathbf{\Lambda}}^2 = -\hbar^2\hat{\mathbf{\Lambda}}^2$ is the square magnitude of the linear momentum
- Since $\hat{\mathbf{L}}^2 Y_{lm_l} = l(l+1)\hbar^2$, the angular momentum is quantized as $\sqrt{l(l+1)}\hbar$, where l=0,1,2,... is the angular momentum quantum number

19

Diatomic Rigid Rotor

- The mathematics of this model, two particles a specific distance apart, can be posed the same way as a Particle on a Sphere
- For two free particles, the Hamiltonian is $\hat{\mathbf{H}} = -\frac{\hbar^2}{2m_1}\hat{\nabla_1}^2 -\frac{\hbar^2}{2m_1}\hat{\nabla_1}^2$.

• To consider a rigid rotor, we will simply the expression using,
$$\frac{1}{m_1}\nabla_1^2 + \frac{1}{m_2}\nabla_2^2 = \frac{1}{m}\nabla_{cm}^2 + \frac{1}{\mu}\nabla^2$$
, where

- $m = m_1 + m_2$ is the total mass of the system
- -=-+- is the reduced mass (also seen for harmonic oscillator) $\mu = m_1 + m_2$
- ∇^2 pertains to relative coordinates of the two atoms.

Solutions to the RR

$$-\frac{\hbar^2}{2m}\hat{\nabla}_{cm}^2\Psi - \frac{\hbar^2}{2\mu}\hat{\nabla}^2\Psi = E_{total}\Psi$$
 is the Schrodinger equation

- Separation of variables $\Psi = \Psi_{cm} \Psi$ leads to
- $-\frac{\hbar^2}{2m}\nabla_{cm}^2\Psi_{cm}=E_{cm}\Psi_{cm}, \text{ which is a free particle}$

$$-\frac{\hbar^2}{2\mu}\nabla^2\Psi=E\Psi$$

•
$$E_{total} = E + E_{cm}$$

• Since the separation between particles, a, is constant,

particles,
$$a$$
, is constant,
$$-\frac{\hbar^2}{2\mu a^2}\Lambda^2\Psi=E\Psi. \text{ With }I=\mu a^2,$$

this is a particle on the sphere!

- Solutions are spherical harmonics
- Energy levels $E_{JM_J} = J(J+1)\frac{\hbar^2}{2I}$
- Model for microwave spectroscopy

Review

- Compare the allowed quantum numbers, energy levels, and energy gaps for a particle in a box, harmonic oscillator, particle on a ring, and particle on a sphere
- What are spherical harmonics?
- What is the relationship between l, m_l , and the number of angular nodes?
- Which analytical systems are models for infrared and microwave spectroscopy?
